

Iran's Foreign Minister Says Iran Is Willing to Allow Japanese Vessels to Pass Through the Strait of Hormuz — How Should We View This Statement? What Considerations Lie Behind It?

Zhihu

War is the continuation of politics; it is an activity within the sphere of the superstructure, and the limits of such activity are ultimately determined by the economic base. The war between the US/Israel and Iran has already greatly disrupted the global industrial chains, shaking the very foundation of global capitalist industrial production (on transnational capitalist production, see my article: The Rise and Fall of the Capitalist World-System (II): The Internal Structure of Transnational Production Capitalism). The global bourgeoisie will inevitably demand that the governments of the non-belligerent countries contain the war's impact, push for the war's end, and ensure production continues normally.

As we predicted earlier, this war cannot end within a week; it will become a war of attrition (see: Iran says the missiles it has launched so far are merely clearing out inventory, having caused 200 American casualties; it is about to deploy a series of "mysterious weapons" — what might they be?). The war has now lasted nearly a month; the Iranian regime has not collapsed, yet the global economy has already fallen into a panic — a panic on every front.

The interruption of oil and gas supply affects not only transport and the like, but has a huge impact on other industries:

Data show that Japanese companies supply more than 90% of the world's ArF photoresist and nearly 100% of EUV photoresist — core materials indispensable for manufacturing advanced chips of 7nm and below. More than 95% of Japan's crude oil and naphtha depends on imports from the Middle East, of which 70%–80% must pass through the Strait of Hormuz. Naphtha reserves suffice for only 20–30 days, and the buffer stock of the high-purity raw materials needed for photoresist production is even more limited. Once this maritime lifeline of energy is cut, Japan's photoresist industry will face the plight of "cooking without rice"... A medium-term blockade (3–6 months) will trigger even more serious consequences — large-scale production cuts and shutdowns of advanced ArF/EUV lines, and a sharp contraction of global supply of high-end photoresist. Japanese companies' revenue will be severely hit, forcing layoffs and business contraction^[1]. The Middle East is not only an energy export centre, but also a major global production base of petrochemical raw materials. Blockage of the strait controlling access to the Persian Gulf will directly affect the market supply of a variety of basic

chemicals. According to Morgan Stanley's latest force-majeure tracking report of 13 March, since the outbreak of the conflict, force-majeure declarations for the world's major chemical products have shown a chain reaction spreading across regions and categories. The olefin chain has become the worst-hit area of this round of shock. As of 12 March, 3.9% of global ethylene capacity was under force majeure, and 3.2% of propylene. By region, the hardest hit are Southeast Asia and Central Europe: affected ethylene capacity in Southeast Asia is as high as 20.4%, and in Central Europe an astonishing 60.2%^[2].

Beyond oil and gas, interruptions in the supply of other industrial products have also brought major effects.

For example, Qatar's helium:

Helium may seem niche, but it is a strategic gas spanning high-end research, industrial manufacturing, medical care, and aerospace. Consumption data for February 2026 confirm its core value: analysis, engineering, laboratory research, and specialty gases account for 22% — the largest end-use; controlled environments, optical fibre and semiconductors, and lifting gases tie for second at 17% each; MRI medical uses 15%; aerospace 9%; welding 8%; diving and leak detection 5% each; other uses 2%. Although after the 2022 Russia-Ukraine conflict, South Korea and other countries pushed hard for diversification of helium and neon supply and domestic mass production, three years later dependence on Qatari helium remains as high as 64% — diversification has achieved little. This situation confirms that the restructuring of the semiconductor supply chain is no short-term matter: long-term contract binding, technical barriers, and capacity monopolies make it hard for downstream enterprises to switch sources quickly. To date, Qatar's helium facilities show no sign of restarting; the Middle East conflict keeps escalating, and the 14-day supply-cut warning line is approaching. Whether the global chip industry can survive this ordeal depends not only on the geopolitical situation, but on whether the industrial chain can quickly fill this "tiny but fatal" short board^[3].

And overseas countries' polypropylene, polyethylene, and other chemical products:

Middle Eastern production facilities have also suffered direct hits. Kuwait's EQUATE declared its 1.15 million tonnes/year ethylene glycol under force majeure; Saudi Arabia's Sadara Chemical Company announced supply interruption of its ethanolamines and glycol ethers. Behind this supply crisis is the international market's heavy dependence on Middle Eastern chemicals. The Middle East holds about 35% of global polyethylene capacity and 28% of polypropylene capacity; the blockage of its exports has directly created a monthly supply gap of nearly 3 million tonnes of polyolefins in the international market. The expectation of supply interruption has been quickly reflected in prices. The North American spot market set the example first: ethylene spot prices rose 24.0% over the last week of February, North American propylene rose 12.8%, and North American polypropylene spot prices soared 25.0%^[4]. The crazy rise in upstream raw material prices is relentlessly crushing every far end of the industrial chain. GF Securities' 16 March building-materials industry report noted that, affected by

the US-Iran conflict, prices of key raw materials for building materials have soared compared with the start of the year: acrylic acid +134.8%, polyethylene +29.2%, PVC +26.4%.

There is also the aluminium supply of Qatar, Bahrain, and the UAE:

If oil is the blood of industry, aluminium is its bones. The Middle East is a key link in the global aluminium chain: in 2025, the region's total electrolytic aluminium capacity was 6.92 million tonnes, with actual output of 6.85 million tonnes — 9% of global supply. The region's aluminium industry is quite sensitive to the safety of shipping through the Strait of Hormuz, facing a two-way threat to its raw material imports and finished product exports. On 3 March, Qatar's aluminium smelter halted production after its facilities were attacked, its 648,000-tonne annual capacity accounting for 0.82% of the world; the next day, Alba of Bahrain declared force majeure and halted production, its 1.6 million-tonne annual capacity accounting for 2% of the world. By now, about 30% of the Middle East's electrolytic aluminium capacity has been materially affected^[5].

And the methanol of Iran and Saudi Arabia:

According to ICIS supply-demand data, methanol is Iran's largest chemical export, with exports of over 9 million tonnes in 2025; Saudi Arabia's methanol exports are also close to 4 million tonnes. ICIS data show that in 2025, Iran's methanol was exported mainly to China, with a small amount to India; Saudi supply went to China, India, the EU, and other regions. Methanol is mainly used to produce formaldehyde, MTBE, and acetic acid, with smaller amounts for DMT, MMA, methyl chloride, methylamine, ethylene glycol monomethyl ether, and fuel uses such as DME, biodiesel, and direct gasoline blending. The rise in methanol prices has also passed through to these products. In the coming weeks, the geopolitical situation will be the focus of the whole methanol chain, and demand for methanol derivatives in Q2 will be re-evaluated^[6].

And urea, sulphur, and other fertiliser-related products:

What many have not noticed is that this artery carries not only energy but also the "food of food" — fertiliser. About one-third of global fertiliser trade, and nearly half of sulphur exports, pass through here. War-torn Iran, the gatekeeper of this waterway, is itself a major global fertiliser producer. Iran and Qatar together account for about 20% of global urea trade volume. Iran, for instance, sits on the world's second-largest natural gas reserves. Natural gas is the main feedstock for producing urea (nitrogen fertiliser), and the sulphur obtained by desulphurising natural gas is key to producing phosphate fertilisers. With this unique advantage, Iran has long been one of the world's top three urea and sulphur exporters. Look at urea: India has a considerable rigid domestic supply gap that depends on imports — it is the world's largest urea importer; look at phosphate fertilisers: about half depend on imports; look at potash: having no domestic potash capacity, India depends almost entirely on imports. About 70% of India's urea imports come from countries around the Strait of Hormuz. Block this passage, and India's "grain" is cut off directly^[7].

The capacity of these chemical products cannot be expanded on demand — for example, a urea plant takes 2–3 years or even longer from groundbreaking to production^{[8][9]}.

Globalised production has today completed the process of quantitative change leading to qualitative change. For instance, many countries import chemicals directly from the Middle East rather than processing them at home, so once war breaks out, for most countries it is not at all as simple as switching oil and gas suppliers to another country. The enormous impact of this war reflects how far our world has travelled along the road of globalisation. In a sense, the whole world has already formed a civil society based on the material metabolic process of global industrial production — only the state standing opposed to civil society has not yet taken shape; what we face is a world of contending warlords.

Apart from the Iranian regime, which faces a threat of life and death, and the Israeli regime, which wants Iran dead, all other countries hope to restore transport as soon as possible, secure enterprise supplies, and avoid forced shutdowns. Hence, in the Security Council vote on the resolution, China and Russia abstained.

On the afternoon of 11 March local time (the early morning of 12 March Beijing time), the UN Security Council adopted, by 13 votes in favour and 2 abstentions, a draft resolution submitted by Bahrain on behalf of the Gulf Cooperation Council member states and Jordan, supported by 135 UN member states, becoming Security Council Resolution 2817. Russia and China abstained. The resolution condemns Iran's strikes against several Gulf states, holding these acts to violate international law and constitute a threat to international peace and security; it expresses regret at attacks on civilian targets and the civilian casualties; it demands that Iran immediately stop its attacks on these countries and fully fulfil its obligations under international law; it also condemns any Iranian act or threat to close or obstruct international shipping in the Strait of Hormuz^[10].

What does an abstention mean? It means the objective of the matter is unobjectionable, but there is partiality — so one neither supports nor opposes. A similar situation occurred with the resolution on the Houthis in January:

On that day, the UN Security Council adopted Resolution 2812 by 13 votes in favour, 0 against, and 2 abstentions; China and Russia abstained. The Russian representative said: "We cannot support this document. The Security Council's technical extension of the relevant mechanism this time has brought no new value." She stressed that at the request of regional partners, Russia would not block the resolution, but on the basis of the actual situation, the Security Council should focus its attention on monitoring vessels in the Caribbean waters rather than the Red Sea. Ambassador Sun Lei, China's Deputy Permanent Representative, said in his explanatory statement after the vote on extending the mandate for reporting on ship attacks in the Red Sea that China's voting position reflected the continuity of China's position. The Red Sea, he said, is an important international trade route;

safeguarding the security of the shipping lanes there is the common responsibility of all parties. All parties should respect the navigation rights of commercial vessels in the Red Sea under international law, oppose attacks on and seizure of civilian vessels, and jointly maintain the international trade order^[11].

This time the six countries (now seven, since South Korea has joined^{[12][13]})... The escort operation they claim to be launching is also carried out in the name of "UN Security Council Resolution 2817". In military terms, it would be rather difficult for these six countries to escort shipping, because the performance of the US Navy has shown that Iran's anti-ship missiles are capable of sinking or crippling advanced surface warships. So the six countries' resolution is more a form of political pressure, aimed at forcing Iran to let their vessels pass and reduce the impact on non-belligerents. The Iranian regime is no fool either; its aim is survival, and it will not really make enemies of all 135 UN member states. What Iran wants is for each country to negotiate with it; and in such negotiations it will certainly raise all kinds of demands — for example, that a country must not open its bases to the US for launching attacks on Iran.

Trump's war gang has also felt the pressure. "The International Energy Agency (IEA) has officially defined the current global energy crisis as the largest supply disruption in the history of the oil market"^[14]. The rise in oil and other industrial goods prices is causing inflation worldwide, which will shake the political foundations of the Trump clique; and the bourgeoisie of the various countries, badly hurt economically, has already started up its media machines and all kinds of lobbying channels to push Trump to stop the war.

On the one hand, Trump wants to send amphibious assault ships to seize islands; on the other, he claims to be "considering a gradual de-escalation of military operations against Iran"^{[15][16]}. It is unclear now whether Trump will really take a further military gamble. But from a military point of view, the US no longer has the conditions to launch a ground offensive. First, a large-scale assembly of troops would inevitably come under Iran's long-range fire, and sending a few thousand men to seize an Iranian island would only turn those few thousand into cannon fodder. Second, in the words of European arms dealers, "if the US-Israel-Iran war lasts another month, missile stockpiles will be exhausted".

On the Iranian side, it also realises that this practice of holding the global economy hostage and overturning the table cannot be sustained, so it has proposed that "China can serve as a mediator between the United States and Iran"^{[17][18]}. And while striking US bases in the Gulf states, it also declares that "Iran does not seek conflict or war with Islamic countries. They are our brothers."

In a world of globalised production, the position of the "warlords" is in fact more solid. One does not even need nuclear weapons like North Korea: with missiles, drone production capacity, and a certain

strategic depth, one can control a vast area within the radius of one's missiles. Iran's successful experience will inevitably inspire a group of middle powers — Turkey, Brazil, Indonesia — to develop independent ballistic missiles and satellite positioning systems as soon as possible.

Because the development of the capitalist world is uneven, there will always be countries torn by internal contradictions that need to shift contradictions abroad through war. This makes war an inevitable phenomenon. In a unipolar world, such wars have limited impact on the global economy, because the single pole can control the direction of the war. But after America's decline, the unipolar world cannot be restored. Even if China replaces America as the largest pole, it cannot replicate America's "unipolar moment." Multipolarity will be a long-term basic structure (see: How Many Poles in a Multipolar World? A Look Ahead to 2050). Before the transnational proletariat steps onto the stage of history as a political force, the transnational bourgeoisie cannot solve the phenomenon of "contending warlords"; so this chaotic situation of constant military conflict will continue for many years, from time to time causing crises at the global level.
